Cephalosporins and homologues, preparations and pharmaceutical compositions

This invention relates to novel β -lactam containing compounds, their preparation and their use, and in particular to a novel class of cephalosporins. These compounds have antibacterial properties, and are therefore of use in the treatment of bacterial infections in humans and animals caused by a wide range of organisms.

GB 1 385 831 (Hoechst) claims 7-acylamino-cephem-carboxylic acid compounds substituted at the 7-position by a group:

in which R^a and R^b , which may be the same or different, each represents a hydrogen atom or an alkyl group having from 1 to 5 carbon atoms or R^a and R^b together represent an alkylene group which may be substituted, R^c represents a hydrogen atom or an alkyl group having from 1 to 5 carbon atoms, X represents a single bond or an NH group, A represents a phenylene or thienylene group which may be substituted and Y represents a single bond or an oxygen atom;

and substituted at the 3-position by an alkyl group having from 1 to 5 carbon atoms, or a cyclo-alkyl group having from 3 to 7 ring carbon atoms which may include one or more hetero ring atoms. Tetrahydrofuranyl is described as an example of a 3-position substituent from a list of 14 radicals. The Examples describe only methyl, ethyl and isopropyl groups at the 3-position of the cephalosporin nucleus.

-2-

We have now found a particular class of cephalosporins bearing a cyclic ether substituent at the 3-position of the cephalosporin nucleus that possesses prolonged and high levels of antibacterial activity, and shows good absorption both parentally and orally, especially orally.

The present invention provides a compound of formula (I) or a salt thereof:

wherein

R^1 is hydrogen, methoxy or formamido;

R^2 is an acyl group, in particular that of an

20 antibacterially active cephalosporin;

CO_2R^3 is a carboxy group or a carboxylate anion, or R^3 is a readily removable carboxy protecting group (such as a pharmaceutically acceptable in vivo hydrolysable ester group); R^4 represents up to four substituents selected from

25 alkyl, alkenyl, alkynyl, alkoxy, hydroxy, halogen, amino, alkylamino, acylamino, dialkylamino, CO_2R , CONR_2 , SO_2NR_2 (where R is hydrogen or C_{1-6} alkyl), aryl and heterocyclyl, which may be the same or different and wherein any R^4 alkyl substituent is optionally substituted by any other R^4

30 substituent; X is S, SO, SO_2 , O or CH_2 ; m is 1 or 2; and n is 0.

The bonding carbon atom of the cyclic ether moiety which links the ring to the cephalosporin nucleus is generally 35 asymmetric. The present invention includes either

-3-

stereoisomer, as well as mixtures of both isomers.

In compounds of formula (I) wherein R^1 is formamido, the formamido group can exist in conformations wherein the 5 hydrogen atoms of the $-NH-CHO$ moiety are cis- or trans-; of these the cis conformation normally predominates.

Since the β -lactam antibiotic compounds of the present invention are intended for use as therapeutic agents in 10 pharmaceutical compositions, it will be readily appreciated that preferred compounds within formula (I) are pharmaceutically acceptable, i.e. are compounds of formula (Ia) or pharmaceutically acceptable salts or pharmaceutically acceptable in vivo hydrolysable esters 15 thereof:

wherein R^1 , R^2 , R^4 , m , n and X are as defined with respect to formula (I) and the group CO_2R^6 is CO_2R^3 where CO_2R^3 is a 25 carboxy group or a carboxylate anion.

Accordingly, the present invention provides a compound of formula (Ia) or a pharmaceutically acceptable salt or in vivo hydrolysable ester thereof, for use as a therapeutic 30 agent, and in particular an in vivo hydrolysable ester thereof for use as an orally administrable therapeutic agent.

-4-

The present invention further provides a compound of formula (Ia) or a pharmaceutically acceptable salt or in vivo hydrolysable ester thereof, for use in the treatment of bacterial infections, more particularly an in vivo hydrolysable ester thereof for use in the oral treatment of bacterial infections.

The present invention also includes a method of treating bacterial infections in humans and animals which comprises the administration of a therapeutically effective amount of an antibiotic compound of this invention of the formula (Ia) or a pharmaceutically acceptable in vivo hydrolysable ester thereof, in particular the oral administration of a therapeutically effective amount of an in vivo hydrolysable ester.

In addition, the present invention includes the use of a compound of formula (Ia) or a pharmaceutically acceptable salt or in vivo hydrolysable ester thereof, for the manufacture of a medicament for the treatment of bacterial infections, in particular the use of an in vivo hydrolysable ester for the manufacture of a medicament for the oral treatment of bacterial infections.

Those compounds of the formula (I) wherein R^3 is a readily removable carboxy protecting group other than a pharmaceutically acceptable in vivo hydrolysable ester or which are in non-pharmaceutically acceptable salt form are primarily useful as intermediates in the preparation of compounds of the formula (Ia) or a pharmaceutically acceptable salt or pharmaceutically acceptable in vivo hydrolysable ester thereof.

Suitable readily removable carboxy protecting groups for the group R^3 include groups forming ester derivatives of the carboxylic acid, including in vivo hydrolysable esters. The derivative is preferably one which may readily be cleaved in vivo.

It will be appreciated that also included within the scope of the invention are salts and carboxy-protected derivatives, including in vivo hydrolysable esters, of any 5 carboxy groups that may be present as optional substituents in compounds of formula (I) or (Ia). Also included within the scope of the invention are acid addition salts of any amino group or substituted amino group that may be present as optional substituents in compounds of formula (I) or 10 (Ia).

Suitable ester-forming carboxyl-protecting groups are those which may be removed under conventional conditions. Such groups for R^3 include benzyl, p-methoxybenzyl, 15 benzoylmethyl, p-nitrobenzyl, 4-pyridylmethyl, 2,2,2-trichloroethyl, 2,2,2-tribromoethyl, t-butyl, t-amyl, allyl, diphenylmethyl, triphenylmethyl, adamantyl, 2-benzyloxyphenyl, 4-methylthiophenyl, tetrahydrofuran-2-yl, tetrahydropyran-2-yl, pentachlorophenyl, acetonyl, 20 p-toluenesulphonylethyl, methoxymethyl, a silyl, stannyl or phosphorus-containing group, an oxime radical of formula $-N=CHR^7$ where R^7 is aryl or heterocyclic, or an in vivo hydrolysable ester radical such as defined below.

A carboxyl group may be regenerated from any of the above esters by usual methods appropriate to the particular R³ group, for example, acid- and base- catalysed hydrolysis, or by enzymically-catalysed hydrolysis, or by hydrogenolysis under conditions wherein the remainder of the molecule is substantially unaffected.

Examples of suitable pharmaceutically acceptable in vivo hydrolysable ester groups include those which break down readily in the human body to leave the parent acid or its salt. Suitable ester groups of this type include those of part formulae (i), (ii), (iii), (iv) and (v):

ii) converting the group CO_2R^3 into a different group CO_2R^3 ;

20

iii) converting the group R^2 into a different group R^2 ;

iv) converting the group X into a different group X ;

25

v) converting the product into a salt.

Acids of formula (III) may be prepared by methods known in the art, or methods analogous to such processes. Suitable
30 processes include those described, for example, in UK Patent 2 107 307 B, UK Patent Specification No. 1,536,281, and U.K. Patent Specification No. 1,508,064.

-19-

Suitable groups which permit acylation to take place and which are optionally present on the amino group of the starting material of the formula (II) include N-silyl, N-stannyl and N-phosphorus groups, for example trialkylsilyl groups such as trimethylsilyl, trialkyltin groups such as tri-*n*-butyltin, groups of formula $-P.R^{20}R^{21}$ wherein R^{20} is an alkyl, haloalkyl, aryl, aralkyl, alkoxy, haloalkoxy, aryl, aralkyl, alkoxy, haloalkoxy, aryloxy, aralkyloxy or dialkylamino group, R^{21} is the same as R^{20} or is halogen or R^{20} and R^{21} together form a ring; suitable such phosphorus groups being $-P(OC_2H_5)_2$, $-P(C_2H_5)_2$,

A group which may optionally be introduced onto the amino group in the compound of formula (II) is trimethylsilyl.

20 Advantageously the silylation reaction may be carried out in situ, prior to the acylation reaction, with a silylating agent that does not require concomitant addition of base. Suitable silylating agents include, for example, N-(trimethylsilyl)-acetamide, N,O-bis-(trimethylsilyl)acetamide, N,O-bis(trimethylsilyl)-trifluoroacetamide, N-methyl-N-trimethylsilylacetamide, N-methyl-N-trimethylsilyl-trifluoroacetamide, N,N'-bis(trimethylsilyl)urea, and N,O-bis(trimethylsilyl)carbamate. A preferred silylating agent is N,O-bis(trimethylsilyl)acetamide. The silylation reaction may suitably be carried out in an inert, anhydrous organic solvent such as dichloromethane at room temperature or at an elevated temperature, for example 30 - 60°C, preferably 40 - 50°C.

35

-20-

The above process may optionally be carried out in the presence of a small quantity, for example 0.1 equivalents, of a silyl halide, for example a tri(C₁₋₆)alkylsilyl halide, especially trimethylsilyl chloride.

5

A reactive N-acylating derivative of the acid (III) is employed in the above process. The choice of reactive derivative will of course be influenced by the chemical nature of the substituents of the acid.

10

Suitable N-acylating derivatives include an acid halide, preferably the acid chloride or bromide or alternatively a symmetrical or mixed anhydride. The acylation may be effected in the presence of an acid binding agent for example, tertiary amine (such as pyridine or dimethylaniline), molecular sieves, an inorganic base (such as calcium carbonate or sodium bicarbonate) or an oxirane, which binds hydrogen halide liberated in the acylation reaction. The oxirane is preferably a (C₁₋₆)-1,2-alkylene oxide - such as ethylene oxide or propylene oxide. The acylation reaction using an acid halide may be carried out at a temperature in the range -50°C to +50°C, preferably -20°C to +20°C, in aqueous or non-aqueous media such as water, acetone, tetrahydrofuran, ethyl acetate, dimethylacetamide, dimethylformamide, acetonitrile, dichloromethane, 1,2-dichloroethane, or mixtures thereof. Alternatively, the reaction may be carried out in an unstable emulsion of water-immiscible solvent, especially an aliphatic ester or ketone, such as methyl isobutyl ketone or butyl acetate. The acylation with acid halide or anhydride is suitably carried out in the presence of a basic catalyst such as pyridine or 2,6-lutidine.

Acid halides may be prepared by reacting the acid (III) or a salt or a reactive derivative thereof with a halogenating (eg chlorinating or brominating) agent such as phosphorus

-21-

pentachloride, thionyl chloride, oxalyl chloride or phosgene.

Suitable mixed anhydrides are anhydrides with, for example, carbonic acid monoesters, trimethyl acetic acid, thioacetic acid, diphenylacetic acid, benzoic acid, phosphorus acids (such as phosphoric, phosphorous, and phosphinic acids) or aromatic or aliphatic sulphonic acids (such as p-toluenesulphonic acid or methanesulphonic acid).

10

Alternative N-acylating derivatives of acid (III) are the acid azide, or activated esters such as esters with 2-mercaptopyridine, cyanomethanol, p-nitrophenol, 2,4-dinitrophenol, thiophenol, halophenols, including pentachlorophenol, monomethoxyphenol, N-hydroxy succinimide, N-hydroxybenzotriazole, or 8-hydroxyquinoline; or amides such as N-acylsaccharins, N-acylthiazolidin-2-thione or N-acylphthalimides; or an alkylidene iminoester prepared by reaction of the acid (III) with an oxime.

20

Other reactive N-acylating derivatives of the acid (III) include the reactive intermediates formed by reaction in situ with a condensing agent such as a carbodiimide, for example, N,N'-diethyl-, dipropyl- or diisopropylcarbodiimide, N,N'-di-cyclohexyl-carbodiimide, or N-ethyl-N'-[3-(dimethylamino)propyl]- carbodiimide; a suitable carbonyl compound, for example, N,N'-carbonyldiimidazole or N,N'-carbonyldi- triazole; an isoxazolinium salt, for example, N-ethyl-5-phenylisoxazolinium-3-sulphonate or N-t-butyl-5-methylisoxazolinium perchlorate; or an N-alkoxycarbonyl 2-alkoxy-1,2-dihydroquinoline, such as N-ethoxycarbonyl 2-ethoxy-1,2-dihydroquinoline. Other condensing agents include Lewis acids (for example BBr₃ - C₆H₆); or a phosphoric acid condensing agent such as diethylphosphorylcyanide. The condensation reaction is

-22-

preferably carried out in an organic reaction medium, for example, methylene chloride, dimethylformamide, acetonitrile, alcohol, benzene, dioxan or tetrahydrofuran.

5 A further method of forming the N-acylating derivative of the acid of formula (III) is to treat the acid of formula (III) with a solution or suspension preformed by addition of a carbonyl halide, preferably oxalyl chloride, or a phosphoryl halide such as phosphorus oxychloride, to a
10 halogenated hydrocarbon solvent, preferably dichloromethane, containing a lower acyl tertiary amide, preferably N,N-dimethylformamide. The N-acylating derivative of the acid of formula (III) so derived may then be caused to react with a compound of formula (II). The acylation reaction may
15 conveniently be carried out at -40° to $+30^{\circ}\text{C}$, if desired in the presence of an acid binding agent such as pyridine. A catalyst such as 4-dimethylaminopyridine may optionally also be added. A preferred solvent for the above acylation reaction is dichloromethane.

20

The optional reduction step, the optional conversion of R^2 to a different R^2 , CO_2R^3 to a different CO_2R^3 and X to a different X, and the optional formation of a salt, may be carried out using methods well known in the art of
25 cephalosporin and penicillin chemistry.

For example, when the group X is S, SO, or SO_2 , the group X may be converted into a different group X by methods of oxidation or reduction well known in the art of
30 cephalosporin and penicillin synthesis, as described, for example, in European Patent Application Publication No. 0 114 752. For example, sulphoxides (in which X is SO) may be prepared from the corresponding sulphide (in which X is S) by oxidation with a suitable oxidising agent, for example
35 an organic peracid such as m-chloroperbenzoic acid.

-23-

A reduction step is generally effected by processes well known in the art of β -lactam chemistry, for example using phosphorus trichloride in dimethylformamide.

5 In the process described hereinabove, and in the process described hereinbelow, it may be necessary to remove protecting groups. Deprotection may be carried out by any convenient method known in the art such that unwanted side reactions are minimised. Separation of unwanted by-products
10 may be carried out using standard methods.

In a further process of the invention, compounds of formula (I) may be prepared by cyclising a compound of formula (IV):

wherein X, R^1 , R^2 , R^4 , m, n and CO_2R^3 are as hereinbefore defined and P' is a phosphorus residue; and thereafter if
25 necessary or desired, carrying out one or more of the following steps:

- i) removing any protecting groups;
- 30 ii) converting the group CO_2R^3 into a different group CO_2R^3 ;
- iii) converting the group R^2 into a different group R^2 ;

-24-

- iv) converting the group X into a different group X;
- v) converting the product into a salt.

5 The cyclisation reaction is an intramolecular Wittig-type reaction and is typically carried out by heating the compound of formula (IV) in an organic solvent system, for example in toluene, optionally in the presence of a suitable acid such as benzoic acid.

10

The phosphorus residue, P' is typically a trialkylphosphoranylidene residue, for example a C₁₋₆ trialkylphosphoranylidene residue such as tri-n-butylphosphoranylidene, or a triarylphosphoranylidene residue such as triphenylphosphoranylidene.

Where R² in a compound of formula (I) is required to be different from the group R² in the compound of formula (IV), the conversion may be effected via the intermediacy of a
20 compound of formula (II) which has an amino group at the 7-position of the cephalosporin nucleus.

An R² side-chain may be removed by the Delft procedure commonly used in β -lactam chemistry. Suitable reaction
25 conditions include treatment with phosphorus pentachloride and N-methylmorpholine at reduced temperature.

Compounds of formula (II) are novel compounds and as such form part of the invention.

30

A compound of formula (IV) may be prepared from a compound of formula (V):

-25-

wherein X, R¹, R², R⁴, m, n and CO₂R³ are as hereinbefore defined, by reaction with a halogenating agent, suitably a
 10 chlorinating agent such as thionyl chloride, which reaction displaces the formula (V) hydroxyl group by halogen, suitably chloride, and is typically carried out at reduced temperature in an inert solvent, for example in
 15 pyridine derivative such as 2,6-lutidine. Formation of the phosphorane may be effected by treatment of the halo-intermediate with an appropriate phosphine derivative, for example tri-n-butylphosphine or triphenylphosphine, suitably at ambient temperature in an inert solvent such as
 20 dioxan.

A compound of formula (V) may be prepared by reaction of a compound of formula (VI):

wherein X, R¹, R², R⁴, m and n are as hereinbefore defined with an ester of glyoxylic acid (OCHCO₂R³) in the presence of triethylamine.

35

SUBSTITUTE SHEET

In a typical preparation of a compound of formula (VI) in which X is sulphur, a compound of formula (VII):

wherein Y is a leaving group and R⁴, m and n are as hereinbefore defined is reacted with a compound of formula (VIII):

wherein R¹ and R² are as hereinbefore defined.

15 Suitably, a leaving group Y is halogen, for example chloro. The reaction may be carried out at ambient temperature in an inert solvent, for example acetone or dimethylformamide, in the presence for a base, for example potassium carbonate.

20 A compound of formula (V) may also be prepared by reaction of a compound of formula (IX):

-27-

wherein R^1 , R^2 and CO_2R^3 are as hereinbefore defined and X' is an X-group precursor, with a compound of formula (VII) as hereinbefore defined.

5 In a typical preparation of a compound of formula (V) in which X is sulphur, a Y leaving group in a compound of formula (VII), suitably a halogen such as chloro or bromo, is displaced by an X' mercapto group in a compound of formula (IX). The reaction may be carried out at ambient
10 temperature in an inert solvent, for example acetone, with the addition of base, for example potassium carbonate, before work-up.

Azetidin-2-one compounds of formulae (VIII) and (IX) may be
15 prepared according to known methods in heterocyclic synthetic chemistry and particularly by known methods in the art of β -lactam chemistry. For example a compound of formula (VIII) may be prepared according to the method of Osborne N.F. et al., J. Chem. Soc., Perkin Trans. I, 146,
20 1980.

A compound of formula (IX) in which X' is a mercapto group may be prepared by ring opening of a 4-thia-2,6-diazabicyclo [3.2.0]-hept-2-ene-7-one derivative according to the method
25 of Masayuki Narisada et al., Tetrahedron Lett., 1755 (1978).

Compounds of formula (VII) are known compounds or may be prepared by standard methodology. For example, the compounds of formula (VII) in which Y is chloro or bromo may
30 be prepared from the corresponding carboxylic acid ($Y=COOH$) via formation of the acid chloride followed by treatment with diazomethane and reaction of the resulting diazo compound with hydrogen chloride or hydrogen bromide.

-28-

In a further process of the invention, compounds of formula (I) may be prepared directly by organo-cuprate displacement of a leaving group at the 3-position of a compound of formula (X):

(XI)

wherein Z is an organo-cuprate group and R^4 and m are as hereinbefore defined.

A compound with a 3-position leaving group, L, in which X is sulphur may be prepared by the procedure of Farina V. *et al.*, J. Org. Chem., 54, 4962, (1989).

A compound with a 3-position leaving group, L, in which X is CH_2 may be prepared by a transition metal-catalysed carbenoid insertion reaction of a diazodicarbonyl compound of formula (XII):

-29-

5

(XII)

wherein R^1 , R^2 and CO_2R^3 are as hereinbefore defined,
 followed by reaction with an appropriate anhydride, for
 10 example triflic anhydride. Compounds of formula (XII) may
 be prepared by the procedure of Bodurow C. and Carr M.A.;
 Tetrahedron Lett., 30 4801, (1989).

It should be noted that in processes of this invention
 15 Δ^2 -cephems may function as intermediates, in the
 synthetic sequences. Subsequent isomerisation steps by
 methods well known in cephalosporin chemistry will provide
 the Δ^3 -cephems of the invention.

FURTHER INFORMATION CONTINUED FROM THE SECOND SHEET

V. ☒ OBSERVATION WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE ¹

This International search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claim numbers 55 because they relate to subject matter not required to be searched by this Authority, namely:
see rule 39.1(iv)

2. ☒ Claim numbers because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
The search has been systematically performed for the compounds of formula I and II as far as X represents -CH - or S and its oxides (the only examples described)

3. ☐ Claim numbers because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(e).

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING ²

This International Searching Authority found multiple inventions in this international application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the international searching authority did not invite payment of any additional fee.

Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
